# THE ULTIMATE SOLAR GUIDE.

**Solar should feel simpler than it does. But somewhere between rising energy bills, confusing quotes, battery jargon, and bold savings claims, a lot of homeowners end up stuck in research mode.**

This guide was created to change that.
Inside, you'll find straightforward advice, realistic expectations, and the information that matters when deciding whether solar is right for your home.

# SOLAR DOESN’T NEED TO FEEL COMPLICATED

There’s a lot of noise around solar. One company says your home is perfect for it. Another tells you batteries are essential. Online calculators promise huge savings that don’t always feel believable. It’s no surprise so many homeowners feel unsure about where to start.

The truth is: solar can be an excellent investment, but only when it’s designed properly around your home, your energy usage, and your goals. That’s why we created this guide to help you understand:

**WHETHER SOLAR MAKES SENSE FOR YOUR HOME**

**WHAT ACTUALLY IMPACTS SAVINGS**

**WHETHER BATTERY STORAGE IS WORTH IT**

**HOW TO AVOID THE COMMON MISTAKES PEOPLE MAKE WHEN CHOOSING A SYSTEM**

Just useful information from people who believe homeowners need the right information to make an informed decision.

# IS SOLAR RIGHT FOR YOUR HOME?

The best solar systems start with the right questions. Solar isn't about having a "perfect" home. It's about understanding how your household uses energy and whether a system can make a meaningful difference to your bills over time.

Many homeowners assume solar won't work for them because: their roof isn't south-facing, they live in the UK, or they think they need a huge system to see savings. In reality, modern solar systems are far more flexible than most people realise.

**Solar should be a good fit if:**

- **Your electricity bills have increased noticeably**
- **You're home during the day**
- **You charge an EV or plan to**
- **You want more control over energy costs**
- **You plan to stay in your home for several years**
- **You simply want to rely less on the grid**

**And importantly:** you don't need perfect conditions for solar to work well.
A professionally designed system matters far more than generic assumptions.

# WHAT ACTUALLY IMPACTS SAVINGS?

Savings aren't just about the panels. This is one of the biggest misunderstandings around solar. Two homes with the same number of panels can see completely different results. Why? Because real savings depend on how your household uses energy.

**The biggest factors that affect solar savings:**

***When you use electricity***
Homes that use more electricity during the daytime often benefit more from solar generation.

---

***Battery storage***
A battery allows you to store unused electricity and use it later. This is especially useful during evenings when energy use is highest.

---

***Roof direction & shading***
South-facing roofs are ideal, but east/west systems can still perform extremely well.

---

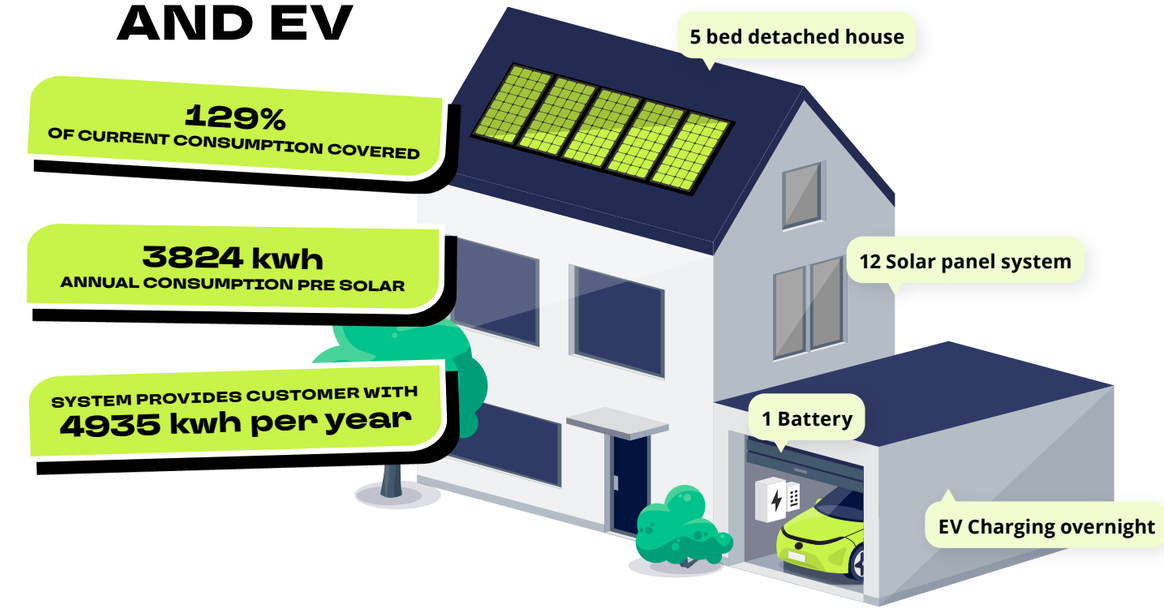

***Household energy habits***
EV charging, heat pumps, working from home, and larger households can all increase the value of solar.

---

***Energy tariffs***
The right tariff can improve the value of exported electricity and battery usage.

**There’s a lot of outdated advice around solar. Let’s clear a few things up...**

## “SOLAR ONLY WORKS IN HOT COUNTRIES.”

Solar panels generate electricity from daylight, not heat. The UK produces solar energy surprisingly effectively throughout the year.

## “BATTERIES MEAN YOU CAN GO COMPLETELY OFF GRID.”

Most homes still use some electricity from the grid. Batteries simply help you use more of the energy your system generates.

## “YOU NEED A SOUTH-FACING ROOF.”

South-facing is ideal. But many east/west-facing systems still generate strong savings. A good design matters more than chasing “perfect” conditions.

## “SOLAR PANELS STOP WORKING AFTER 10 YEARS.”

Most modern panels are designed to last 25 years or more, with long performance warranties included.

## “THE CHEAPEST QUOTE IS THE BEST DEAL.”

Not always. System design, installation quality, warranties, aftercare, and support all matter long after installation day.

# SOLAR PANELS VS SOLAR + BATTERY

Should you add battery storage? For many homeowners, this is the biggest decision. And the right answer depends less on trends and more on how your home uses energy.

## SOLAR WITHOUT BATTERY

**A solar-only system can:**

- Reduce daytime electricity costs,
- Lower upfront investment,
- Still generate meaningful long-term savings

**Best suited for:**

- Homes with daytime energy usage

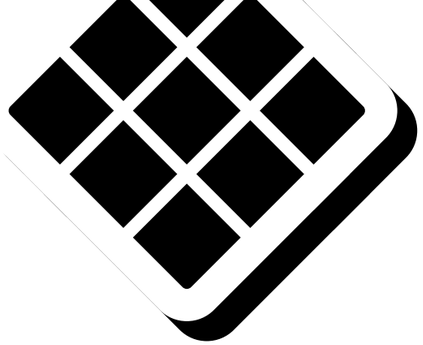

## SOLAR WITH BATTERY STORAGE

**A battery allows you to:**

- Store unused solar energy,
- Use more of your own electricity,
- Reduce evening grid usage,
- Potentially benefit from smart energy tariffs

**Best suited for:**

- Homes with higher evening usage, EV charging, or homeowners wanting greater energy independence

## BATTERIES AREN'T ESSENTIAL FOR EVERYONE.

For some households, batteries dramatically improve savings. For others, solar panels alone may already provide strong value.

The key is understanding what works best for your home, not following a one-size-fits-all recommendation.

**CURIOUS WHETHER A BATTERY WOULD BENEFIT YOUR HOME?**

# WHAT SHOULD A GOOD SOLAR QUOTE INCLUDE?

A solar quote should feel clear, not confusing.

**A trustworthy installer should explain:**

- **How savings are calculated**
- **What's included**
- **Why the systems being recommended**

If a quote feels vague, rushed, or overly sales-focused, it's worth asking more questions.

**Lookout for these red flags:**

- **Pressure to "sign today"**
- **Unrealistic savings claims**
- **No discussion about your energy habits**
- **Unclear warranty information**
- **Generic recommendations without property analysis**

**A good quote should clearly explain:**

- **Monitoring apps**
- **System size**
- **Warranties**
- **Installation timescales**
- **Aftercare support**
- **Expected yearly generation**
- **Battery capacity**

## A PROPERLY DESIGNED SOLAR SYSTEM SHOULD MAKE SENSE ON PAPER AND IN REAL LIFE.

## YOU DESERVE CLARITY BEFORE MAKING A DECISION.

### WANT A SECOND OPINION ON A QUOTE?

We'll review it with you honestly and explain anything that feels unclear.

# WHAT INSTALLATION LOOKS LIKE

Here’s what the process normally looks like. For most homeowners, installation is much simpler than they expect.

STEP 1

**HOME ASSESSMENT**

Your roof, usage, and energy goals are reviewed to design the right system.

STEP 2

**SYSTEM DESIGN & APPROVAL**

You’ll receive a clear proposal outlining: system size, projected generation, savings estimates, installation details.

STEP 3

**INSTALLATION DAY**

Most residential systems are installed within 1–2 days. Scaffolding is usually temporary, and disruption is kept to a minimum.

STEP 4

**MONITORING & SUPPORT**

Once installed, you’ll be able to monitor performance through an app and see how much electricity your system is generating.

#1

## SOLAR SHOULD FEEL SIMPLE AFTER INSTALLATION TOO.

Good aftercare matters. Your installer should still be there to answer questions long after the panels are fitted.

# YOUR NEXT STEP

Solar works best when it's designed around your home. No two households use energy the same way.

That's why the best place to start isn't with generic estimates or sales promises... it's with understanding what would genuinely work for your property.

At LIME, we believe solar advice should feel:
**clear, realistic, supportive and pressure-free.**

Whether you're ready to move forward or simply exploring your options, we're here to help you make a confident decision.

JUST STRAIGHT FORWARD ADVICE

## GET YOUR FREE PERSONALISED SOLAR ASSESSMENT

We'll help you understand: potential savings, battery options, expected payback, and what makes the most sense for your home.

**No pressure. No obligation.**
